#### PREFACE

This volume is one of four covering the work done in revising the five socioeconomic scenarios developed for the FAA in the study entitled, "Alternative Future Scenarios for the National Aviation System."\* That study was directed at depicting various alternative future conditions that may exist in the United States and may impact on the National Aviation System (NAS).

While the basic positions differentiating the scenarios are the same here as in the previous study, insights into socioeconomic changes gained during the preceding 18 months have been incorporated into this study. New variables have been selected to better characterize the alternative "external worlds" which may influence the development of the NAS. New events important to shaping the nature of these worlds have been identified and incorporated into the scenarios. Furthermore, the scenario sections on economics have been greatly augmented to give substantive descriptions of the economic and financial processes in each scenario and a new section dealing with international conditions has been added to each of the scenarios.

Volume 1, Executive Summary, and Volume 2, Scenario Descriptions and Graphics, present the results of the study. Volume 3, Methods and Data for Projecting the Variables, explains how projections were made for each of the variables selected to help quantify scenario development. This volume contains supporting information on event and variable selections and on event probabilities which was used in making the projections described in Volume 3.

<sup>\*</sup>Alternative Future Scenarios for the National Aviation System, Report 174-72-01, prepared for the Systems Concepts Branch, Federal Aviation Administration (Glastonbury, CT: The Futures Group, August 1975).

#### Other Volumes (Bound under separate cover)

### Volume 1: Executive Summary

#### PREFACE

- 1. INTRODUCTION
- 2. SCENARIO SUMMARIES AND RESULTS

### Volume 2: Scenario Descriptions and Graphics

#### PREFACE

- 1. INTRODUCTION
- 2. SCENARIO NARRATIVES
- 3. FEDERAL GOVERNMENT EXPENDITURES FOR NON-DEFENSE AERONAUTICAL RESEARCH AND DEVELOPMENT
- 4. PROJECTIONS OF THE VARIABLES
- 5. MAJOR SCENARIO EVENTS

### Volume 3: Methods and Data for Projecting the Variables

#### PREFACE

- 1. INTRODUCTION
- 2. THE TIA PROCEDURE
- 3. DATA USED IN MAKING THE PROJECTIONS

### 1. MASTER EVENT LIST AND EVENT PROBABILITIES

All of the events used in the study are listed in Table 1, together with the probabilities for each event. The probabilities represent the judgment of the study team on the likelihood of the occurrence of an event in each scenario for the years 1980, 1990, and 2000. The key and NAS event are identified, and for these events the rationale for the probability selections may be found in Volume 2, Scenario Descriptions and Graphics.

| SCENARIO       | DATE           | 190. European Community (EC) achieves a monetary union with currency parities established by the Council and further fluctuations are controlled by a Central European Bank. | *191. EC negotiates a series of preferential trade agreements with OPEC countries embodying preferred EC access to OPEC crude oil at below world prices and OPEC discrimination in favor of EC exports, in exchange for EC technology, technical assistance, and lower tariffs on OPEC manufactured products. | 192. EC cohesion diminishes as monetary cooperation-the joint float-fails, the Commission loses all initiative, and the customs union dissolves, as EC members unilaterally raise tariffs against each other's exports. | 193. Communist parties in Italy, Spain, Portugal, and France become dominating forces in left of center governing coalitions, and the Labor Party in the UK comes under central of its left wing. | 194. The EC expands to include, as formal members, Portugal, Spain, Greece, Austria, Switzerland, Tugoslavia, and Norway. | 195. The OECD financial support fund becomes operational, lending at low interest rates to any OECD country suffering balance of payments deficits from petroleum imports. | 196. CECD negotiates a mandatory code of conduct for multinational corporations assuring national treatment for all MNC's, protection against expropriation and forced modification of agreements, and prohibiting political activity by MK's. | *197. Development of North Sea oil and natural gas, and further growth in nuclear power in France, the United Kingdom, Italy, and West Germany enable Europe to supply 65 percent of its energy needs. | 198. The United Kingdom and France establish currency controls to stem the flow of investment funds to other developed and underdeveloped countries. |

| SCENARIO       | DATE           | 159. The Conference on International Economic Gooperation (CIEC) negotiates a broad agreement on doot relicf for LDC's involving forgiveness of external debt to DC governments in exchange for assurances on access to LDC raw materials. | 200. GATE megorizations result in a system of DC preferences for LDC exports, and a new GATT organization governing DC-LDC trade, which links level of tatiff preference to level of LDC development. | 201. Latin American governments adopt legislation to acquire majority ownership of all multinational. corporations (EXC's) to export at least one-third of their production, to limit NNC's repartition of capital, and to require all locally produced goods to contain 75 percent local content. | 202. Latin American Economic System (SELA) achieves increased regional economic cooperation throughout Latin America, including a customs union, common Latin American positions on NNC's, tariff preferences and commodity trade, and successfully promotes specific interregional economic projects in areas such as energy, raw material development, and transfortation. | 203. Venerablum public investments total \$37 billion, principally for empansion of steel and aluminum making, shipbuilding, hydroelectric power, petroleum, and petrochemical production capacity. | 204. Bizzil invests \$70 billion on major development projects for energy, minerals, new agricultural lands, steel making, hydroelectric power, and transportation. | 295. Latin American governments completely liberalize their trade and investment controls over imports of goods and capital. | 206. Escalating guerrilla warfare and radicalization of Latin American governments lead to expropriation of tinancial assessments and renunciation of debts to developed countries. |

#### 2. EVENT-VARIABLE MATRIX

The selection of events to impact each variable projected by TIA is shown by the three event-variable matrices of Table 1. The matrices show the events which have been used in the trend impact analyses of the general socioeconomic variables, the financial variables, and the international variables. To assure comprehensiveness in event selection, events in the general socioeconomic area were arranged in several categories, as shown in Table 1. Events in these categories (demography and life-style, technology/resources, business/economics, politics/legislation, the labor force, and education) relate primarily to the general socioeconomic development of each scenario, while events in the financial matrix and international matrix pertain to these more specific areas. However, as may be expected some of the same events were found to impact the variables in more than one area. This was especially true with respect to the financial variables, on which a number of the general socioeconomic events were found to have an impact, as may be seen from the financial event-variable matrix of Table 1.

Events were assigned to one or more variables. In carrying out the trend impact analyses of the variables (described in Volume 3, Methods and Data for Projecting the Variables), all of the events assigned to each variable were used to compute its future projection.

| 214. Japanese government adopts controls on the  |                                       |   |  |  |                          |                            |                              | х                              |                                  |                                    |                                      |  |             |
| export of capital.  215. Japan and the EC become involved in a trade war involving competitive devaluations of currency, trade, and investment restrictions.   | Х                                     | X                                       |  |  | Х                        | Х                          |                              | Х                              |                                  |                                    |                                      |  |             |
| 216. Japan enters preferential trade agreements,<br>embodying preferred access to markets and<br>raw materials, and technology transfer, with<br>certain LDC/s, including Brazil, Mexico, and<br>Venetuela.  |                                       |   |  |  | х                        | х                          | Х                            | х                              | х                                | х                                  |                                      |  |             |
| 217. Japanese programs to stimulate technological<br>innovation achieve technological parity or<br>superiority in data processing, electric<br>automobiles, and pollution abatement equipment.   | х                                     |   |  |  | х                        | х                          | х                            | х                              | х                                |                                    |                                      |  |             |
| 218. The International Energy Agency (IEA) becomes a permanent organization with authority over an IEA oil stockpile, compulsory sharing of oil during emergencies, OECD-wide energy conservation and R&D, and an OECD oil price floor to encourage new investments. |                                       |   |  |  |                          |                            |                              |                                |                                  |                                    |                                      |  | x           |
| 219. OPEC countries increase their long-term, direct<br>investment in developed countries to the level<br>of one-half their annual surplus.  |                                       |   |  |  |                          |                            |                              |                                |                                  |                                    |                                      |  | Х           |
| . 220. OPEC countries continue to spend large portions of oil revenues on imports of products and technology.  |                                       |   |  |  |                          |                            |                              |                                |                                  |                                    |                                      |  | Х           |
| 221. A formal settlement between Israel and the Arab countries (Egypt, Syria, and Jordon) is achieved, embodying guarantees of Israeli security, border adjustments, and resolution of the Palestinian issue.  |                                       |   |  |  |                          |                            |                              |                                |                                  |                                    |                                      |  | х           |
| 222. Conflict again erupts between Israel and<br>the Arab states, with further Israeli oc-<br>cupation and diplomatic/strategic stalemate.   |                                       |   |  |  |                          |                            |                              |                                |                                  |                                    |                                      |  | X           |
| 223. War among the Arab states breaks out, pit-<br>ting the front line states against Iraq,<br>Libva, and the Palestinians.  |                                       |   |  |  |                          |                            |                              |                                |                                  |                                    |                                      |  | X           |
| 224. The IEA and OPEC agree to an indexation plan for linking crude oil prices to general level of inflation in manufactured products.   |                                       |   |  |  |                          |                            |                              |                                |                                  |                                    |                                      |  | х           |
| 225. North Sea, Mexican, and PRC oil enter world markets in large volumes, causing OPEC exports to fall to 20 million barrels per day or less.   |                                       |   |  |  |                          |                            |                              |                                |                                  |                                    |                                      |  | x           |

#### 3. REFERENCES FOR KEY AND NAS EVENTS

The following references are given for key and NAS events. The references contain relevant background material for each of these events. The literature is suggestive of the potential trends and occurrences which underlie the event statements. In general, because the literature did not always provide a succinct statement of an event, the specific event statements were formulated by The Futures Group staff. Thus, while the events were suggested by the literature, they were phrased by the staff to give the specificity and quantification necessary to evaluate their impacts.

- Event 1: Establishment of 10 new resorts comparable to Disney World.
  - Gobben G. Greer, "Super Colossal Amusement Parks: America's 15 Eest,"
    Better Homes and Gardens (August 1974).
- Event 7: Federal guidelines are developed to serve as a voluntary framework for planning population distribution among the various states and regions.
  - Population and the American Future: The Report of the Commission on Population Growth and the American Future to the President (March 1972). This event appears as one of the Commission's recommendations on p. 120.
- Event 10: New cities are developed proximate to natural resources.
  - Population and the American Future: The Report of the Commission on Population Growth and the American Future to the President (March 1972). This report examines the relationship of population distribution to land use planning. In The Futures Group report,

    A Technology Assessment of Geothermal Energy Resource Development prepared for the National Science Foundation (April 15, 1975),
    p. 4.6 contains a discussion of the growth of new cities at geothermal energy sites.
- Event 11: Use of telecommunications reduces the amount of all travel by 20 percent.

We was seen you and a so as a

James Martin, Future Developments in Telecommunications (Englewood Cliffs, MJ: Prentice-Hall, 1971); Charlton R. Price, Conferencing Via Computer, Innovation and Information Analysis Project, Program of Policy Studies in Science and Technology (Washington, DC: George Washington University, 1974).

- Event 13: The marriage rate declines to 8 per 1000 population (a little over 10 per 1000 population in 1975).
  - Alan C. Kerckhoff, "Patterns of Marriage and Family Formation and Disillusion," <u>Journal of Consumer Research</u>, Vol. 2 (March 1976);
    A. J. Morton and P. C. Glick, "Marital Instability: Past, Present, and Future," Journal of Social Issues, Vol. 32, No. 1 (1976).
- Event 23: Synthetic gas from coal is commercially available.
  - "Coal Research (II): Gasification Faces an Uncertain Future," Science (August 27, 1976); "Synthetic Fuel from Coal," Federal Energy Administration Project Independence Blueprint Final Task Force Report (Washington, DC: U.S. Department of the Interior, Movember 1974).
- Event 30: Offshore terminals and refineries are established on the East Coast to provide a capacity approaching area demand for oil products.
  - Department of Planning and Energy Policy, State of Connecticut, Report of the Governor's Task Force on Oil Refineries (January 6, 1975).
- Event 34: The Atlantic outer continental shelf produces 1 million barrels of oil per day.
  - Don E. Kash et al., <u>Energy under the Oceans</u> (Norman, OK: University of Oklahoma Press, 1973). This volume contains a technology assessment of the outer continental shelf for oil and gas operations.
- Event 40: Coal and nuclear stations contribute 75 percent of electrical energy.
  - Federal Energy Administration, <u>Project Independence: A Summary</u> (Washington, DC: U.S. Government Printing Office, November 1974). This report discusses the outlook for various fuels under a number of assumptions. One scenario (p. 45) shows coal and nuclear sources to be 74 percent of electric generation inputs in 1985.
- Event 42: Non-petroleum sources of primary power for ground transportation (storage batteries, fuel cells, electromagnetic propulsion and the like) account for one-quarter of the transportation energy demand.
  - Douglas G. Harvey and W. Robert Menchen, The Automobile, Energy and the Environment: A Technology Assessment of Advanced Automobile Propulsion Systems (Columbia, MD: Hittman Associates, Inc., March 1974).

- Event 45: A national program for raw material resource rationing is established.
  - Hans H. Lansberg, Natural Resources for U.S. Growth: A Look Ahead (Baltimore, MD: Johns-Hopkins University Press, 1964). This monograph reviews the long-term adequacy of U.S. resources and discusses the major issues in resource policy. Eugene M. Cameron (ed.), The Mineral Position of the United States, 1975-2000 (Madison, WI: University of Wisconsin Press, 1973). This report examines the relationship of demand to production in the United States in the light of expressed concern over this country's mineral situation.
- Event 46: Environmentally acceptable pest control fails to provide adequate crop protection.
  - C. Djerassi, C. Shih-Coleman, and J. Dickman, "Insect Control of the Future: Operational and Policy Aspects," <u>Science</u> (November 15, 1974); this article suggests that unless certain policies are implemented it is unlikely that there will be any new approaches to insect control in the next decade. "Cosmetic Standards: Are Pesticides Overused for Appearances Sake?" Science (August 27, 1976).
- Event 47: More than 10,000 miles of the interstate highway system are electrified and automated to accommodate dual-mode automobiles.
  - Jon E. Burkhardt et al., Project Metran: An Integrated Evolutionary Transportation System for Urban Areas, MIT Report 8 (Cambridge, MA: Massachusetts Institute of Technology, Spring 1966); Daniel Brand, "Bringing Logic to Urban Transportation Innovation," MIT Technology Review (January 1976).
- Event 51: Developing countries form cartels for key raw materials: bauxite, manganese, tin, and chromium.
  - Nathaniel Leff, "The New Economic Order--Bad Economics, Worse Politics,"

    Foreign Policy, No. 24; James Theberge, "Raw Materials," Foreign
    Policy, No. 17; Fred Bergsten, "The Response to the Third World,"

#### 4. CROSS-IMPACT ANALYSIS

#### Introduction--Methodology

One important consideration in constructing scenarios is that the characteristics of the events which significantly shape each scenario, and which result from it, should be consistent. Unless care is taken, events which are described in the narratives easily can be mutually exclusive. In other terms, the likelihoods of occurrence of the events should be consistent with the sense of the scenario. And the likelihood of one event should be consistent with the likelihoods of all other events for each scenario.

In this study, cross-impact analysis (developed initially by Gordon and Helmer in the late 1960's and used by many industrial concerns) was employed to ensure that the consistency was maintained among the likelihoods of the key and NAS events. This analytic technique is based upon the premise that the occurrence (or non-occurrence) of an event will influence the likelihood (or probabilities of occurrence) of other events. Certain events, by their occurrence, make it impossible for other events to occur. If Mr. Jones is not nominated for President he will not be elected. Conversely,

T. J. Gordon and H. Hayward, "Initial Experiments with the Cross-Impact Matrix Method of Forecasting," Futures, Vol. 1, No. 2 (December 1968), pp. 100-116; T. J. Gordon, "Cross-Impact Matrices: An Illustration of Their Use for Policy Analysis," Futures, Vol. 1, No. 6 (December 1969), pp. 528-531; T. J. Gordon and H. S. Becker, "The Use of Cross-Impact Matrix Approaches in Technology Assessment," in M. J. Cetron and B. Bartocha (eds.), The Methodology of Technology Assessment (New York: Gordon and Breach, 1972), pp. 127-136; T. J. Gordon and H. S. Becker, "Analysis of Ailing Products---It's Decisions That Count: A Case Study of R&D Decision Methodology," presented at the Industrial Research Institute (Glastonbury, CT: The Futures Group, October 1971; revised February 1972).

the occurrence of certain events makes other possibilities more likely than they otherwise would have been. Increases in crude oil prices by OPEC are likely to increase inflation rates in the United States, at least in the near term.

Several specific and often thought-provoking steps are required to complete a cross-impact analysis:

- Listings of events which might occur during the time period of interest and which are believed to be important to the specific problem under consideration (in this case important to the shape of parameters or trend curves depicting socioeconomic conditions for each of the scenarios).
- 2. Estimating the probability of occurrence of each event during the time period of interest (e.g., by 1990 for each scenario).
- Estimating how the occurrence (or non-occurrence) of each event in the selected set will affect the probability of occurrence of all other events (i.e., completing the nonimpact matrix<sup>2</sup>).
- 4. Using the cross-impact matrix, or model, resulting from the above estimates and adjusting the event probabilities (from step 2) or the conditional probabilities (from step 3) where inconsistencies exist.

A fifth step is often employed to assess the likely effect of contemplated policies on the probabilities of all the events in the set. This step is used to assist in policy formulation and choice. Indeed this aspect of policy analysis is one of the major reasons for employing cross-impact analysis. In this step candidate policies are formulated. In one method of analysis, the policies might be treated as events. As such they would be included into the above process. The other analytic approach is to estimate

trationary - to wrong the

<sup>&</sup>lt;sup>2</sup>In the matrix the entry in a cell represents the probability of occurrence of the event listed at the head of that column under the presumption that the event in that row has occurred.

how each policy might affect the probabilities of each of the events (i.e., adjustments would be made to the probabilities prepared in step 2. The matrix then would be used (as described in the references) to determine what the event probabilities would be in light of the coupling or cross-impacts among events due to the estimates of the conditional probabilities from step 3. It is this latter method of using cross-impact analysis which is recommended when policy analysis is the basic focus of the research.

But as noted earlier in this study, the technique was employed here to improve the consistency among the probabilities of occurrence of each of the events for the scenarios which were being investigated. This discipline was brought to bear because of the relationships among mutually dependent events that must be explored when cross-impact analysis is applied. For example, limits exist on the conditional probabilities (from step 3) of mutually likely events. Having once decided upon the likely probability (from step 2) of the two mutually probable events, upper and lower limits exist for the probability of occurrence of one event under the assumption that the other is certain to occur (or not to occur). Indeed, such limits have long been recognized by statistical theory. In simplified form they can be described as follows.

As probability of occurrence represents the number of times in alternative future worlds in which an event may occur, we can view the limits on the mutual occurrence of two probabilistic events in terms of the maximum and minimum coincidence of their occurrence in such future worlds. If we have two events, the first with a probability of 80 percent and the second 40 percent, the maximum coincidence in their occurrence results when four out of the ten times the second event can occur happens in those eight worlds when the first event is anticipated to occur.

|                       | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | Potential "Future Worlds"           | 2 |
|-----------------------|---|---|---|---|---|---|---|---|---|----|-------------------------------------|---|
| $P_1 = 0.80$          | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |   |    | HOLIUS                              |   |
| P <sub>2</sub> = 0.40 | 2 | 2 | 2 | 2 |   |   | 2 | 2 | 2 | 2  | Maximum Coincider Minimum Coincider |   |

The minimum likelihood of occurrence of the second event if the first occurs exists when the worlds in which the latter does not occur are completely occupied by the second event with the remaining chances for occurrence of the second event happening in coincidence with the first. In this case, two out of the ten times the second event can occur it does so in worlds which do not include the first event, leaving two of eight times when they can occur jointly. These limiting conditions can be expressed mathematically:

If E, occurs:

Minimum probability of 
$$E_2 = 2/8 (0.25)$$

$$P_{\text{max}} = \frac{P_2 - (1 - P_1)}{P_1} (> 0)$$

If estimates are made of conditional probabilities which lie behind these limits, clearly one of the estimates is irrational. Hence, one can then reassess the probabilities assigned to each of the events or to the conditional probability and adjust one or all of those estimates accordingly.

Additional insights become available which also are directly pertinent to real world planning. These relate to the improved ability to view which events from a set of probable events are truly worthy of further consideration. Once a cross-impact matrix has been constructed it is easy to scan the rows and columns to determine whether or not an individual event will cause significant changes in the likelihood of the others if

it were to occur. <sup>3</sup> Conversely, it is easy to view from such estimates where events are highly reactive to the occurrence of other events. If items are not influential or do not respond to other eventualities, one becomes hard pressed to rationalize a need for their continued consideration. Hence, cross-impact analysis illuminates which events are the actors (or big swingers) and which are the reactors in the play.

As noted earlier, it is not unusual for estimates of conditional probability to lie outside of the limits. This situation occurred in a few instances in this study, based upon the initial estimates of event probabilities that were made by the study team. Of course, when such a situation arises the estimator is forced to re-evaluate all his estimates. The initial probabilities (from step 2) of the mutually likely events should be reassessed along with the conditional probabilities (from step 3). When that is done, a new but now internally consistent view of the future as to the likelihood of important events can be prepared.

$$P_{2,(1)} = \frac{P_2 - (P_1 \times P_{2,1})}{1 - P_1} \quad (0 \leq P_{2(1)} \leq 1)$$

Where P<sub>1</sub> = probability of the impacting event in the time period of interest.

P<sub>2</sub> = probability of the impacted event
 in the time period of interest.

P<sub>2,1</sub> = probability of the impacted event if the impacting event occurs.

P<sub>2,(1)</sub> = probability of the impacted event if the impacting event does not occur.

 $<sup>^3</sup>$ Having obtained such insights and having resolved important discrepancies in event probabilities or in conditional probabilities, the non-occurrence matrix then can be computed from:

Thus the discipline created by cross-impact analysis requires that the thought process be carried one or two steps further than is typical in analyzing events and their probabilities. Such soul searching often illuminates inconsistencies in judgments—judgments frequently applied to making decisions which can prove the difference between realistic and meaningful planning—and in policy analysis.

The results of the cross-impact analysis conducted in the study are shown in Table 1. They represent probabilities of occurrence by 1990 for Scenario R for each of the events shown. The numbers in each cell of the matrix are the conditional probabilities. They designate the probability of occurrence of the event listed at the head of each column under the assumption that the event in the row has occurred. The initial probabilities of each event are listed below the event number at the head of each column.

Mathematical solution of the matrix showed that none of the event probabilities changed by more than a few percent. Comparison of the calibration probabilities, which are found from the solution of the matrix, with the initial probabilities is given in Table 2. The small differences between the calibration probabilities and the event probabilities indicate that all the probability judgments are consistent with each other.

#### Insights Obtained from the Cross-Impact Analysis

The study team found a small number of significant inconsistencies in its initial estimates of event probabilities and conditional probabilities.

Although the matrix required that 3422 estimates of conditional probabilities be made, in only four cases were significant changes in the estimates of

Table 1

conditional probability or of event probability required.<sup>4</sup> There were, however, many cases where the conditional probabilities were adjusted to the limits since this represented only a small change, i.e., only a few percent—which was well within the accuracy of the basic estimates.

One adjustment was made in event probability. That occurred in the case of Event 30, 5 "Congress enacts a new tax on goods and services proportional to their environmental impact, allocating these funds for environmental improvements." It had initially been estimated that for Scenario R the probability of this event by 1990 would be 0.40. The conditional probability of this event was estimated at 0.70 assuming that Event 2, "Federal guidelines are developed to serve as a voluntary framework for planning population distribution among the various states and regions," had occurred. The initial probability of Event 2 had been estimated at 0.70. Using the initial probabilities, the maximum probability of Event 30, assuming that event 02 had occurred, would be only 0.40 ÷ 0.70 = 0.57. Thus, either

- 1. The conditional probability of event 30 was too high
- 2. The probability of event 30 was too low, or
- 3. The probability of event 2 was too high

In reexamining the initial judgments it was believed that the occurrence of Event 2, "Establishment of Federal guidelines to serve as a voluntary framework for planning population distribution," would increase markedly the

In order to keep the size of the matrix within bounds, the events selected for cross-impact analysis were limited to key and NAS events.

<sup>&</sup>lt;sup>5</sup>Event numbers refer to the listing of the events in the accompanying cross-impact matrix, Table 1. The corresponding TIA number of the events is given in Table 3.

Table 3

likelihood of Event 30, "Congress enacts a new tax on goods and services proportionate to their environmental impacts, allocating these funds for environmental improvements." Hence the study team was not willing to reduce the conditional probability of Event 30. The initial probability of Event 2 was then questioned. But in Scenario R, which represents a world of important government presence and resource allocations, the study team could not rationally reduce its probability below 0.70. Clearly then, the estimate of the probability of Event 30 was too low. Thus, the probability of Event 30 was raised to 0.50 to make it compatible with its conditional probability, assuming Event 2 occurs.

Three other significant adjustments which were made were of conditional probabilities. This one instance occurred in the case of Event 12, "Nonpetroleum sources of primary power for ground transportation (storage batteries, fuel cells, electromagnetic propulsion, and the like) account for one-quarter of the transportation energy demand," under the presumption that Event 11 occurred. In this case the probabilities of both of the events were believed justified in light of the sense of the scenario. Event 12 was believed to have a probability of only about 1 in 3, or about 30 percent. Event 11, "Coal and nuclear stations contribute 75 percent of electrical energy," was estimated to have a probability of 0.6. Under those conditions the maximum probability of Event 12 would be 0.5. But the initial estimate of its conditional probability was 0.6. Questioning of this conditional probability led the team to recognize that, even with major expansion of coal and nuclear stations to generate electricity, enormous inroads into the current fleet of ground transportation would be required to result in one-quarter of the fleet being powered by non-petroleum resources. Such an

inroad could not realistically be anticipated between now and 1990. The conditional probability of Event 12 was reduced to 0.49.

The conditional probability of Event 16, "Transportation, communication, and energy industries become either public or quasi-public enterprises," had initially been estimated at 0.35, under the assumption that a publicly owned petroleum company was established that supplies 20 percent of the domestic market (Event 26). These two events were estimated as having probabilities of 0.10 and 0.45, respectively. Reexamination of their individual likelihoods resubstantiated these estimates and caused the conditional probability of Event 16 to be reduced to 0.21. The rationale here was that establishment of a publicly owned petroleum company controlling about onefourth of the domestic market would result in an increase in the likelihood of the establishment of public and quasi-public enterprises in the areas of transportation, communication, and energy, as the latter would represent activities quite similar to the publicly owned petroleum company -- and, indeed, would be highly dependent upon fuel from such a company. But a likelihood of 0.21 percent was felt to be sufficiently high to satisfy that condition.

The last event where significant changes were made was 29, "Federal funds for community development, to revitalize cities, increase threefold over the 1975 level." The readjustment occurred when that event was considered in light of the occurrence of Event 31, "A progressive tax is imposed on all energy usage with the proceeds funneled into energy production and conservation R&D programs." These two events had probabilities estimated at 0.5 and 0.7, respectively. It had been estimated initially that if Event 31 occurred the probability of Event 29 would be quite high, its chances of occurrence about 4:1, or a probability of 0.8. But the probabilities individually estimated for these events if they were realistic

would indicate that the conditional probability of Event 29 would be only 0.71. A reassessment of the probabilities of the individual events for Scenario R caused the study team to believe that its initial estimates of these probabilities were still reasonable. But the reconsideration of the conditional probability for Event 29 indicated that the odds of about 2:1, or a probability of about 0.70, were sufficiently high for this event. It was recognized that arguments for participation of the Federal Government in funding community development and in revitalization would be enhanced if other Government programs were established, such as the progressive tax on energy. But the probability of 0.7 under such conditions was felt to be reasonable.

Having reassessed the probabilities of all of the events by 1990 for the Resource Allocation Scenario, it was then possible to reassess the probabilities of these events for the other scenarios. The probabilities of the events in one scenario would have to be compatible with their probabilities in the other scenarios. Furthermore, the event probabilities that were estimated for 1990 also were used to help establish what the likelihoods would be at other points in time for each scenario. It would, of course, have been possible to conduct such a cross-impact analysis for several points in time for each scenario. But the additional time and resources that would have been required for such an analysis were not believed to be warranted, as the bulk of the insights were felt to have been obtained in treating Scenario R and conducting this event cross-impact analysis for 1990.

#### 5. COMPARATIVE LIST OF VARIABLES PROJECTED IN THE REVISED AND ORIGINAL STUDY

Table 1 lists all of the variables projected for each of the revised scenarios and for each of the scenarios in the original study. The variables have been arranged in categories to show their relationship to the development of the scenarios. The revised scenarios include an expanded economics section and, therefore, additional variables were added as may be seen listed in the business and finance category. The revised scenarios also include an added section on international affairs, and Table 1 identifies the set of international variables which were projected.

The list of domestic demographic variables was increased to provide insight into major changes in the national population distribution. The three added variables deal with changes in degree of urbanization and with geographic population shifts. The general population characteristics projected were the same in both studies, except that the one specific age group projected in the revised study was changed to define an age group more closely related to travel demand.

Most of the domestic general economic variables were the same in both studies. Personal consumption expenditures for transportation were added as an important indicator of travel demand. Expenditures for food and beverages were dropped because it was a poor indicator of social affluence. Total Government social welfare expenditures were substituted for Federal social welfare expenditures, and together with total for all Government expenditures, which was added, provided insight into the degree of Government presence in domestic life.

Quality index for food exports

Variables pertaining to the domestic labor force in the revised study include the total labor force participation rate in order to indicate how economic conditions may influence the entrance of women and certain economically marginal groups into the labor force. In the revised study unemployment levels were assumed for each scenario as a defining characteristic of the scenario, and they were not projected as one of the variables. Percent of the labor force in unions was found to contribute little insight and was dropped in the revised study.

In the area of energy and raw materials the degree of independence from foreign oil sources was recognized to have an important bearing on domestic energy policy, and the ratio of domestic crude oil production to consumption was included as a variable in the revised study. Because the OPEC price to the United States of crude petroleum has a primary impact on all energy prices, the OPEC price was selected to replace U.S. wellhead price, which is essentially domestically regulated and responds to OPEC pressures. The price of electricity was included as a variable in the revised scenarios because of its sensitivity to domestic fuel economics and to overall energy demand. Specific material prices (for alumínum and iron ore) were found to contribute little to the scenarios, and these variables were not included in the revised study; rather, the situation with regard to materials was discussed in general terms in the scenario narratives.

Several of the business and financial variables (bond yields, investment funds from internal sources, long-term funds raised in credit markets) are meant to supply an understanding of the soundness of the capital market and the ability of industry to meet its investment needs. The remaining variables in this category relate to the expansiveness of domestic industry. Taken

together, the business and financial variables are used to characterize the state of the industry in this country.

The international variables in the revised study relate to U.S. economic relations with major areas of Europe, Latin America, and the Orient. The size of population and the gross domestic product reveal the growth and general level of affluence for each international area. Economic activity between the United States and each international area is characterized by the imports, exports, and investment variables.
